One line!

discussion posted 25 days ago by [JesusAponteMSE](#)

Feels good to go back and try these out again with shorter code. `n=[x for x in range(len(s)) if s[x]=="a" or s[x]=="e" or s[x]=="i" or s[x]=="o" or s[x]=="u"]; print("Number of vowels:", str(len(n)))`

It really does. Here was my list comprehension version:

```
print ("Number of vowels: " + str(len([i for i in s if i in ['a','e','i','o','u']])))
```

A similar and even more compact option:

```
print("Number of vowels: ", sum(1 for char in s if char in 'aeiou'))
```

That's very clever, dzogpa. It's amazing how many ways you can do the same thing in Python.
