Problem 2

Problem 2 - Getting the User's Guess

10.0/10.0 points (graded)

Next, implement the function `getGuessedWord` that takes in two parameters - a string, `secretWord`, and a list of letters, `lettersGuessed`. This function returns a string that is comprised of letters and underscores, based on what letters in `lettersGuessed` are in `secretWord`. This shouldn't be too different from `isWordGuessed`!

Example Usage:

```
>>> secretWord = 'apple'
>>> lettersGuessed = ['e', 'i', 'k', 'p', 'r', 's']
>>> print(getGuessedWord(secretWord, lettersGuessed))
'_ _ pp_ e'
```

When inserting underscores into your string, it's a good idea to add at least a space after each one, so it's clear to the user how many unguessed letters are left in the string (compare the readability of `____` with `_ _ _ _`). This is called *usability* - it's very important, when programming, to consider the usability of your program. If users find your program difficult to understand or operate, they won't use it!

For this problem, you are free to use spacing in any way you wish - our grader will only check that the letters and underscores are in the proper order; it will not look at spacing. We do encourage you to think about usability when designing.

For this function, you may assume that all the letters in `secretWord` and `lettersGuessed` are lowercase.

```
1 def getGuessedWord(secretWord, lettersGuessed):
2     '''
3     secretWord: string, the word the user is guessing
4     lettersGuessed: list, what letters have been guessed so far
5     returns: string, comprised of letters and underscores that represents
6         what letters in secretWord have been guessed so far.
7     '''
8     # FILL IN YOUR CODE HERE...
9     palavra = ''
10    for letra in secretWord:
11        if letra not in lettersGuessed:
12            palavra += ' _ '
13            # print('não', letra, palavra)
14        else:
15            palavra += ' ' + letra
16            # print('sim', letra, palavra)
```

Press ESC then TAB or click outside of the code editor to exit

Correta

Test results

[Hide output](#)

CORRECT

Test 1

Function call: getGuessedWord('apple', ['e', 'i', 'k', 'p', 'r', 's'])

Output:

' _ p p _ e '

Test 2

Function call: getGuessedWord('durian', ['a', 'c', 'd', 'h', 'i', 'm', 'n', 'r', 't', 'u'])

Output:

' d u r i a n '

Random Test 1

Function call: `getGuessedWord('lettuce', ['f', 'v', 'c', 'd', 'm', 'g', 'r', 'p', 'u', 'w'])`

Output:

' _ _ _ _ u c _ '

Random Test 2

Function call: `getGuessedWord('carrot', ['z', 'w', 'd', 'v', 'h', 'c', 'q', 'j', 'o', 'k'])`

Output:

' c _ _ _ o _ '

Random Test 3

Function call: `getGuessedWord('broccoli', [])`

Output:

' _ _ _ _ _ _ _ _ '

Random Test 4

Function call: `getGuessedWord('carrot', ['n', 'q', 'm', 'g', 'v', 'b', 'a', 'u', 'h', 'r'])`

Output:

' _ a r r _ _ '

Problem with the quotes

5

when I run `print(getGuessedWord(secretWord, lettersGuessed))` on my machine I get this: ' _ p _ ...

How can I replace the letters to ' '?

1 new_

I tried doing `word.replace(i, ' ')` (which is inside a for loop) but that didn't work. I now have `word[loc]...`

How to do this in one line!!

3 new_

Spent hours trying to do this in one line, no luck. Help pls!! I always had to use 'else' or have an in...

Checker being buggy.

7

The Checker is acting buggy again and if you refresh the page you lose an attempt. Annoying...
